

```

<body>
  <div id='app'>
    <router-link to="/account">account</router-link>
    <router-view></router-view>
  </div>
  <template id="temp1">
    <div>
      <h1>这是h1模板</h1>
      <router-link to="/account/login">登陆</router-link>
      <router-link to="/account/rigister">注册</router-link>
      <router-view></router-view>
    </div>
  </template>
  <template id="login">

```

在组件的下面 写一个坑，用来放子组件

```

路由的嵌套.html > html > body > script > router
var login = {
  template: "#login"
}

var rigister = {
  template: "#rigister"
}

var router = new VueRouter({
  routes: [
    {
      path: '/account',
      component: temp,
      children: [
        {path: 'login', component: login},
        {path: 'rigister', component: rigister}
      ]
    },
    // {
    //   path: '/account/login',
    //   component: login
    // },
    // {
    //   path: '/account/rigister',
    //   component: rigister
    // }

```

用 children 嵌套子组件的路由，注意里面的path写的时候 不写 / 否则永远用根路径去请求地址
